1. Which editor panel was least familiar to you, and how did you work out what it does?

The editor panel that was least familiar to me was the Inspector. At first, I was unsure what all the properties were for. I worked it out by selecting different nodes and observing how the Inspector changed. I also tried changing some properties and seeing the results in the game.

2. What installation, setup, or Git issue did you or your pair-partner run into, and how did you resolve it?

One issue we encountered was with Git, especially when trying to connect or update the project with the repository. We solved it by checking that the repository was correctly connected, making sure we were in the correct project folder, and then pulling/pushing the changes again. We also made sure our project files were saved before committing.

3. In your own words, what is the relationship between a node, a scene, and the scene tree

In Godot, a node is an individual building block of a game, such as a character, camera, button, or light. A scene is a collection of nodes saved together that can represent something like a level, player, or menu. The scene tree shows how the nodes are organized in a parent-and-child structure. In simple terms, nodes make up scenes, and the scene tree shows how those nodes are connected and organized.
